

# Package ‘drimmR’

February 26, 2021

**Type** Package

**Title** Estimation, Simulation and Reliability of Drifting Markov Models

**Version** 1.0.0

**Author** Vlad Stefan Barbu,  
Geoffray Brelurut,  
Annthomy Gilles,  
Arnaud Lefebvre,  
Victor Mataigne,  
Alexandre Seiller,  
Nicolas Vergne

**Maintainer** Nicolas Vergne <Nicolas.Vergne@univ-rouen.fr>

**Description** This package introduces the drifting Markov models (DMM) which are non-homogeneous Markov models designed for modeling the heterogeneities of sequences in a more flexible way than homogeneous Markov chains or even hidden Markov models. In this context, we developed an R package dedicated to the estimation, simulation and the exact computation of associated reliability of drifting Markov models. The implemented methods are described in Vergne, N. (2008), <doi:10.2202/1544-6115.1326> and Barbu, V.S., Vergne, N. (2019) <doi:10.1007/s11009-018-9682-8> .

drimmR-package

*drimmR-package*

## Description

This package performs the estimation, simulation and the exact computation of associated reliability measures of drifting Markov models (DMMs). These are particular non-homogeneous Markov chains for which the Markov transition matrix is a linear (polynomial) function of two (several) Markov transition matrices. Several statistical frameworks are taken into account (one or several samples, complete or incomplete samples, models of the same length). Computation of probabilities of appearance of a word along a sequence under a given model are also considered.

---

|     |   |
|-----|---|
| aic | <i>Akaike Information Criterion (AIC)</i> |
|-----|---|

---

### Description

Generic function computing the Akaike Information Criterion of the model x, with the list of sequences sequences.

### Usage

```
aic(x, sequences)
```

### Arguments

|           |  |
|-----------|--|
| x         | An object for which the log-likelihood of the DMM can be computed.   |
| sequences | A vector of characters or a list of vector of characters representing the sequences for which the AIC will be computed based on x. |

### Value

A list of AIC (numeric)

### Author(s)

Victor Mataigne, Alexandre Seiller

### References

```
## Not run:
data(lambda, package = "drimmR")
sequence <- c("a","g","g","t","c","g","a","t","a","a","a")
dmm <- fitdmm(lambda, 1, 1, c('a','c','g','t'), init.estim = "freq", fit.method="sum")
aic(dmm,sequence)

## End(Not run)
```

---

availability

*Availability function*

---

**Description**

The pointwise (or instantaneous) availability of a system  $S_{system}$  at time  $k \in N$  is the probability that the system is operational at time k (independently of the fact that the system has failed or not in  $[0; k)$ ).

**Usage**

```
availability(x, k1 = 0L, k2, upstates, output_file = NULL, plot = FALSE)
```

## Arguments

|             |  |
|-------------|--|
| x           | An object of class dmm   |
| k1          | Start position (default value=0): a positive integer giving the start position along the sequence from which the availabilities of the DMM should be computed, such that $k1 < k2$ |
| k2          | End position : a positive integer giving the end position along the sequence until which the availabilities of the DMM should be computed, such that $k2 > k1$                     |
| upstates    | Character vector giving the subset of operational states U.  |
| output_file | (Optional) A file containing matrix of availability probabilities (e.g, "C:/.../AVAL.txt")   |
| plot        | FALSE (default); TRUE (display a figure plot of availability probabilities by position)  |

## Details

Consider a system (or a component) System whose possible states during its evolution in time are  $E = \{1 \dots s\}$ . Denote by  $U = \{1 \dots s_1\}$  the subset of operational states of the system (the upstates) and by  $D = \{s_1 + 1 \dots s\}$  the subset of failure states (the down states), with  $0 < s_1 < s$  (obviously,  $E = U \cup D$  and  $U \cap D = \emptyset, U \neq \emptyset, D \neq \emptyset$ ). One can think of the states of U as different operating modes or performance levels of the system, whereas the states of D can be seen as failures of the systems with different modes.

## Value

A vector of length  $k+1$  giving the values of the availability for the period  $[0 \dots k]$

## Author(s)

Alexandre Seiller

| bic | <i>Bayesian Information Criterion (BIC)</i> |
|-----|---|

---

### Description

Generic function computing the Bayesian Information Criterion of the model x, with the list of sequences sequences.

### Usage

```
bic(x, sequences)
```

### Arguments

|           |   |
|-----------|---|
| x         | An object for which the log-likelihood of the DMM can be computed.                          |
| sequences | A list of vectors representing the sequences for which the BIC will be computed based on x. |

### Value

A list of BIC (numeric)

```

---

|             |                               |
|-------------|-------------------------------|
| failureRate | <i>Failure rates function</i> |
|-------------|-------------------------------|

---

### Description

Computation of two different definition of the failure rate : the BMP-failure rate and RG-failure rate.

As for BMP-failure rate, consider a system  $S$  starting to work at time  $k = 0$ . The BMP-failure rate at time  $k \in N$  is the conditional probability that the failure of the system occurs at time  $k$ , given that the system has worked until time  $k - 1$ . The BMP-failure rate denoted by  $\lambda(k), k \in N$  is usually considered for continuous time systems.

The RG-failure rate is a discrete-time adapted failure-rate proposed by D. Roy and R. Gupta. Classification of discrete lives. *Microelectronics Reliability*, 32(10):1459–1473, 1992. The RG-failure rate is denoted by  $r(k), k \in N$ .

### Usage

```
failureRate(
  x,
  k1 = 0L,
  k2,
  upstates,
  failure.rate = c("BMP", "RG"),
  output_file = NULL,
  plot = FALSE
)
```

### Arguments

|                           |   |
|---------------------------|---|
| <code>x</code>            | An object of class <code>dmm</code>   |
| <code>k1</code>           | Start position (default value=0) : a positive integer giving the start position along the sequence from which the failure rates of the DMM should be computed, such that $k1 < k2$            |
| <code>k2</code>           | End position : a positive integer giving the end position along the sequence until which the failure rates of the DMM should be computed, such that $k2 > k1$                                 |
| <code>upstates</code>     | Character vector of the subspace working states among the state space vector such that $upstates < s$   |
| <code>failure.rate</code> | Default="BMP", then BMP-failure-rate is the method used to compute the failure rate. If <code>failure.rate="RG"</code> , then RG-failure rate is the method used to compute the failure rate. |
| <code>output_file</code>  | (Optional) A file containing matrix of failure rates at each position (e.g, "C:/.../ER.txt")  |
| <code>plot</code>         | FALSE (default); TRUE (display a figure plot of failure rates by position)  |

### Details

Consider a system (or a component) System whose possible states during its evolution in time are  $E = \{1 \dots s\}$ . Denote by  $U = \{1 \dots s_1\}$  the subset of operational states of the system (the upstates) and by  $D = \{s_1 + 1 \dots s\}$  the subset of failure states (the down states), with  $0 < s_1 < s$  (obviously,  $E = U \cup D$  and  $U \cap D = \emptyset, U \neq \emptyset, D \neq \emptyset$ ). One can think of the states of  $U$  as

different operating modes or performance levels of the system, whereas the states of D can be seen as failures of the systems with different modes.

### Value

A vector of length  $k + 1$  giving the values of the BMP (or RG) -failure rate for the period  $[0 \dots k]$

### Author(s)

Alexandre Seiller

```

---

fitdmm

*Point by point estimates of a k-th order drifting Markov Model*

---

### Description

Estimation of  $d+1$  points of support transition matrices and  $|E|^k$  initial law of a  $k$ -th order drifting Markov Model starting from one or several sequences.

### Usage

```
fitdmm(
  sequences,
  order,
  degree,
  states,
  init.estim = c("mle", "freq", "prod", "stationary", "unif"),
  fit.method = c("sum")
)
```

## Arguments

|            |  |
|------------|--|
| sequences  | A list of character vector(s) representing one (several) sequence(s)   |
| order      | Order of the Markov chain  |
| degree     | Degree of the polynomials (e.g., linear drifting if degree=1, etc.)  |
| states     | Vector of states space of length $s > 1$   |
| init.estim | Default="mle". Method used to estimate the initial law. If <code>init.estim = "mle"</code> , then the classical Maximum Likelihood Estimator is used, if <code>init.estim = "freq"</code> , then, the initial distribution <code>init.estim</code> is estimated by taking the frequencies of the words of length $k$ for all sequences. If <code>init.estim = "prod"</code> , then, <code>init.estim</code> is estimated by using the product of the frequencies of each letter (for all the sequences) in the word of length $k$ . If <code>init.estim = "stationary"</code> , then <code>init.estim</code> is estimated by using the stationary law of the point of support transition matrices of each letter. If <code>init.estim = "unif"</code> , then, <code>init.estim</code> of each letter is estimated by using $\frac{1}{s}$ . Or 'init.estim' = customisable vector of length $ E ^k$ . See Details for the formulas. |
| fit.method | If sequences is a list of several character vectors of the same length, the usual LSE over the sample paths is proposed when <code>fit.method="sum"</code> (a list of a single character vector is its special case).  |

## Details

The `fitdmm` function creates a drifting Markov model object `dmm`.

Let  $E = 1, \dots, s$ ,  $s < \infty$  be random system with finite state space, with a time evolution governed by discrete-time stochastic process of values in  $E$ . A sequence  $X_0, X_1, \dots, X_n$  with state space  $E = 1, 2, \dots, s$  is said to be a linear drifting Markov chain (of order 1) of length  $n$  between the Markov transition matrices  $\Pi_0$  and  $\Pi_1$  if the distribution of  $X_t$ ,  $t = 1, \dots, n$ , is defined by  $P(X_t = v \mid X_{t-1} = u, X_{t-2}, \dots) = \Pi_{\frac{t}{n}}(u, v)$ ,  $u, v \in E$ , where  $\Pi_{\frac{t}{n}}(u, v) = (1 - \frac{t}{n})\Pi_0(u, v) + \frac{t}{n}\Pi_1(u, v)$ ,  $u, v \in E$ . The linear drifting Markov model of order 1 can be generalized to polynomial drifting Markov model of order  $k$  and degree  $d$ . Let  $\Pi_{\frac{i}{d}} = (\Pi_{\frac{i}{d}}(u_1, \dots, u_k, v))_{u_1, \dots, u_k, v \in E}$  be  $d$  Markov transition matrices (of order  $k$ ) over a state space  $E$ .

The estimation of DMMs is carried out for 4 different types of data :

**One can observe one sample path :** It is denoted by  $H(m, n) := (X_0, X_1, \dots, X_m)$ , where  $m$  denotes the length of the sample path and  $n$  the length of the drifting Markov chain. Two cases can be considered:

1.  $m=n$  (a complete sample path),
2.  $m < n$  (an incomplete sample path).

**One can also observe  $H$  i.i.d. sample paths :** It is denoted by  $H_i(m_i, n_i)$ ,  $i = 1, \dots, H$ . Two cases cases are considered :

1.  $m_i = n_i = n \forall i = 1, \dots, H$  (complete sample paths of drifting Markov chains of the same length),
2.  $n_i = n \forall i = 1, \dots, H$  (incomplete sample paths of drifting Markov chains of the same length). In this case, an usual LSE over the sample paths is used.

The initial distribution of a  $k$ -th order drifting Markov Model is defined as  $\mu_i = P(X_1 = i)$ . The initial distribution of the  $k$  first letters is freely customisable by the user, but five methods are proposed for the estimation of the latter :

**Estimation based on the Maximum Likelihood Estimator:** The Maximum Likelihood Estimator for the initial distribution. The formula is:  $\hat{\mu}_i = \frac{N_{start_i}}{L}$ , where  $N_{start_i}$  is the number of occurrences of the word  $i$  (of length  $k$ ) at the beginning of each sequence and  $L$  is the number of sequences. This estimator is reliable when the number of sequences  $L$  is high.

**Estimation based on the frequency:** The initial distribution is estimated by taking the frequencies of the words of length  $k$  for all sequences. The formula is  $\hat{\mu}_i = \frac{N_i}{N}$ , where  $N_i$  is the number of occurrences of the word  $i$  (of length  $k$ ) in the sequences and  $N$  is the sum of the lengths of the sequences.

**Estimation based on the product of the frequencies of each state:** The initial distribution is estimated by using the product of the frequencies of each state (for all the sequences) in the word of length  $k$ .

**Estimation based on the stationary law of point of support transition matrix for a word of length  $k$  :**  
The initial distribution is estimated using  $\mu(\Pi_{\frac{k-1}{n}})$

**Estimation based on the uniform law :**  $\frac{1}{s}$

### Value

An object of class dmm

### Author(s)

Geoffray Brelurut, Alexandre Seiller

### Examples

```
## Not run:
data(lambda, package = "drimmR")
states <- c("a", "c", "g", "t")
order <- 1
degree <- 1
fitdmm(lambda, order, degree, states, init.estim = "freq", fit.method = "sum")

## End(Not run)
```

---

getDistribution

*Distributions of the drifting Markov Model*

---

### Description

Generic function evaluating the distribution of a model  $x$  at a given position  $pos$  or at every position  $all.pos$

**Usage**

```
getDistribution(x, pos, all.pos = FALSE, internal = FALSE)
```

**Arguments**

|          |   |
|----------|---|
| x        | An object for which the distributions of the DMM can be computed.   |
| pos      | A positive integer giving the position along the sequence on which the distribution of the DMM should be computed |
| all.pos  | 'FALSE' (evaluation at position index) ; 'TRUE' (evaluation for all position indices)                             |
| internal | 'FALSE' (default) ; 'TRUE' (for internal use of the <a href="#">distributions</a> function)                       |

**Details**

Distribution at position  $l$  is evaluated by  $\mu_l = \mu_0 \prod_{t=k}^l \pi_{\frac{t}{n}}, \forall l \geq k, k \in N^*$  order of the DMM

**Value**

A vector or matrix of distribution probabilities

**Author(s)**

Alexandre Seiller

---

|                  |   |
|------------------|---|
| getStationaryLaw | <i>Stationary laws of the drifting Markov Model</i> |
|------------------|---|

---

## Description

Generic function evaluating the stationary law of a model `x` at a given position `pos` or at every position `all.pos`

## Usage

```
getStationaryLaw(x, pos, all.pos = FALSE, internal = FALSE)
```

## Arguments

|                       |   |
|-----------------------|---|
| <code>x</code>        | An object for which the stationary laws of the DMM can be computed.   |
| <code>pos</code>      | A positive integer giving the position along the sequence on which the stationary law of the DMM should be computed |
| <code>all.pos</code>  | ‘FALSE’ (default, evaluation at position index) ; ‘TRUE’ (evaluation for all position indices)                      |
| <code>internal</code> | ‘FALSE’ (default) ; ‘TRUE’ (for internal use of the initial law computation)  |

## Details

Stationary law at position  $t$  is evaluated by solving  $\mu_t \pi_{\frac{t}{n}} = \mu$

## Value

A vector or matrix of stationary law probabilities

## Author(s)

Alexandre Seiller

```

---

|                 |                                 |
|-----------------|---------------------------------|
| maintainability | <i>Maintainability function</i> |
|-----------------|---------------------------------|

---

## Description

Maintainability of a system at time  $k \in N$  is the probability that the system is repaired up to time  $k$ , given that it has failed at time  $k = 0$ .

## Usage

```
maintainability(x, k1 = 0L, k2, upstates, output_file = NULL, plot = FALSE)
```

## Arguments

|             |  |
|-------------|--|
| x           | An object of class dmm   |
| k1          | Start position (default value=0) : a positive integer giving the start position along the sequence from which the maintainabilities of the DMM should be computed, such that $k1 < k2$ |
| k2          | End position : a positive integer giving the end position along the sequence until which the maintainabilities of the DMM should be computed, such that $k2 > k1$                      |
| upstates    | Character vector of the subspace working states among the state space vector such that $upstates < s$  |
| output_file | (Optional) A file containing matrix of maintainability probabilities (e.g, "C:/.../MAIN.txt")  |
| plot        | FALSE (default); TRUE (display a figure plot of maintainability probabilities by position)   |

## Details

Consider a system (or a component) System whose possible states during its evolution in time are  $E = \{1 \dots s\}$ . Denote by  $U = \{1 \dots s_1\}$  the subset of operational states of the system (the upstates) and by  $D = \{s_1 + 1 \dots s\}$  the subset of failure states (the down states), with  $0 < s_1 < s$  (obviously,  $E = U \cup D$  and  $U \cap D = \emptyset, U \neq \emptyset, D \neq \emptyset$ ). One can think of the states of  $U$  as different operating modes or performance levels of the system, whereas the states of  $D$  can be seen as failures of the systems with different modes.

## Value

A vector of length  $k + 1$  giving the values of the maintainability for the period  $[0 \dots k]$

## Author(s)

Alexandre Seiller

| reliability | <i>Reliability function</i> |
|-------------|-----------------------------|

---

## Description

Reliability or the survival function of a system at time  $k \in N$

## Usage

```
reliability(x, k1 = 0L, k2, upstates, output_file = NULL, plot = FALSE)
```

## Arguments

|             |  |
|-------------|--|
| x           | An object of class dmm   |
| k1          | Start position (default value=0) : a positive integer giving the start position along the sequence from which the reliabilities of the DMM should be computed, such that $k1 < k2$ |
| k2          | End position : a positive integer giving the end position along the sequence until which the reliabilities of the DMM should be computed, such that $k2 > k1$                      |
| upstates    | Character vector of the subspace working states among the state space vector such that $upstates < s$  |
| output_file | (Optional) A file containing matrix of reliability probabilities (e.g, "C:/.../REL.txt")   |
| plot        | FALSE (default); TRUE (display a figure plot of reliability probabilities by position)   |

## Details

The reliability at time  $k \in N$  is the probability that the system has functioned without failure in the period  $[0, k]$

**Value**

A vector of length  $k + 1$  giving the values of the reliability for the period  $[0 \dots k]$

**Examples**

```
## Not run:
data(lambda, package = "drimmR")
dmm <- fitdmm(lambda, 1, 1, c('a','c','g','t'), init.estim = "freq",
  fit.method="sum")
k1 <- 1
k2 <- 200
upstates <- c("c","t") # vector of working states
reliability(dmm,k1,k2,upstates,plot=TRUE)

## End(Not run)
```

---

simulate

*Simulate a sequence under a drifting Markov model*

---

**Description**

Generic function simulating a sequence of length `model_size` under a model `x`

**Usage**

```
simulate(x, output_file, model_size = 1e+05)
```

**Arguments**

|                          |   |
|--------------------------|---|
| <code>x</code>           | An object for which simulated sequences of the DMM can be computed.       |
| <code>output_file</code> | (Optional) File containing the simulated sequence (e.g, "C:/.../SIM.txt") |
| <code>model_size</code>  | Size of the model   |

**Value**

the vector of simulated sequence

**Author(s)**

Annthomy Gilles, Alexandre Seiller

---

simulate.dmm

*Simulate a sequence under a drifting Markov model*

---

**Description**

Simulate a sequence under a k-th order DMM.

**Usage**

```
## S3 method for class 'dmm'
simulate(x, output_file = NULL, model_size = NULL)
```

**Arguments**

|             |   |
|-------------|---|
| x           | An object of class dmm  |
| output_file | (Optional) File containing the simulated sequence (e.g, "C:/.../SIM.txt") |
| model_size  | Size of the model   |

**Value**

the vector of simulated sequence

**Author(s)**

Annthomy Gilles, Alexandre Seiller

```
## Not run:
data(lambda, package = "drimmR")
dmm <- fitdmm(lambda, 1, 1, c('a','c','g','t'), init.estim = "freq", fit.method="sum")
simulate(dmm, model_size=100)

## End(Not run)
```

---

stationary\_distributions

*Stationary laws for a range of positions between <start> and <end>*

---

**Description**

Stationary laws for a range of positions between <start> and <end>

**Usage**

```
stationary_distributions(
  x,
  start = 1,
  end = NULL,
  step = NULL,
  output_file = NULL,
  plot = FALSE
)
```

**Arguments**

|             |   |
|-------------|---|
| x           | An object of class dmm  |
| start       | Start position : a positive integer giving the start position along the sequence from which the stationary laws of the DMM should be computed |
| end         | End position : a positive integer giving the end position along the sequence until which the stationary laws of the DMM should be computed    |
| step        | A step (integer)  |
| output_file | (Optional) A file containing matrix of stationary laws (e.g, "C:/.../SL.txt")   |
| plot        | FALSE (default); TRUE (display a figure plot of stationary distribution probabilities by position)  |

**Value**

A matrix with positions and stationary laws of states

**Author(s)**

Alexandre Seiller

| words_probabilities | <i>Probability of appearance of several words at several positions of a DMM</i> |
|---------------------|---|

---

## Description

Probability of appearance of several words at several positions of a DMM

## Usage

```
words_probabilities(words, pos, x, output_file = NULL, plot = FALSE)
```

## Arguments

|             |   |
|-------------|---|
| words       | A vector of characters containing words   |
| pos         | A vector of integer positions   |
| x           | An object of class dmm  |
| output_file | (Optional) A file containing the matrix of probabilities (e.g, "C:/.../PROB.txt") |
| plot        | FALSE (default); TRUE (display figure plots of words' probabilities by position)  |

## Value

A dataframe of word probabilities along the positions of the sequence

## Author(s)

Victor Mataigne, Alexandre Seiller
